Remote-first; open to relocation worldwide (visa sponsorship welcome)

Software engineer and architect who owns systems end to end: architecture, core build, and direct client delivery. My sweet spot is forward-deployed-style work: take a vague client ask, tinker until I find what the client and the system actually want, and ship it as a production feature. Most recently the primary engineer and architect of an agentic AI compliance SaaS, where I authored 84% of the codebase. Nights and weekends I ship open-source developer tools with real releases on PyPI, npm, and signed APKs.

EXPERIENCE

Software Engineer and Architect - Appson Technologies (Compliance Sarathi) Jan 2026 - Jul 2026

AI compliance SaaS for Indian corporate-governance and ROC/MCA compliance. Designed and built the entire system end to end as primary engineer and architect (542 of 647 commits, 84%; ~146k insertions), with direct client delivery: from vague ask to shipped feature.

- Designed and built the headline feature: an **agentic AI compliance assistant** with a strict truth-wall design. Read tools answer only from a deterministic deadline engine, never model memory; write actions go through propose-then-confirm with server-side re-validation, idempotency keys, per-CIN access checks, and a tamper-resistant audit chain.
- Built the **AI governance control plane**: runtime enable/disable and re-scoping of every agent action by role, multi-provider model management (OpenAI, Gemini, Anthropic behind one interface), per-mode model routing, and usage/cost dashboards.
- Built the **AGM Deadline Engine**: pure-computation module covering 12+ statutory forms (AOC-4, MGT-7, ADT-1, DIR-3 KYC, ITR-6, LLP forms) with entity-type-aware deadlines and per-day penalty calculators.
- Integrated **AI across every document and artifact surface**: SS-1/SS-2-compliant meeting-minutes pipeline (Board/AGM/EGM/Committee), 70+ AI-drafted statutory document types, resolution and report draft pipelines, and resilient chat generation that survives navigation and full reload.
- Built **industry-grade audit and observability**: tamper-resistant audit trail across user and agent actions, structured error logging, and per-call AI usage and cost telemetry; automated QA checks on GitHub pipelines and automated user/admin emails.
- Led the platform's **UI/UX overhaul**: a modern dual-UI rewrite mounted alongside the legacy app, including a full redesign of the recent-entries experience.
- Own the full stack: React 18, Node/Express, MongoDB (27 models, ~25 route groups), JWT auth with RBAC, AWS S3, Twilio, live MCA/CIN lookup, multi-format document generation (Word/Excel/PDF).

Software Engineer - Appson Technologies (client products) Jun 2025 - Jan 2026

Delivered across four client engagements on React, React Native, Node, Python, MongoDB, and AWS:

- Wordibly** (US transcription SaaS, HIPAA-compliant): customer ordering and upload flows, tiered human/hybrid/AI transcription workflows, and transcriber and manager dashboards, through the platform's 2025 redesign generation.
- AI avatar platform**: upload pipeline state logic and frontend delivery on an agile sprint team.
- Document-AI / OCR product**: React Native (Expo) mobile app work including a design-system migration, smart camera and crop scanner workflow, document editing, and chat artifacts.
- Turing** (AI training): short specialist engagement training Meta's Llama models; hands-on LLM data and evaluation work.

OPEN SOURCE (GITHUB.COM/CAPAD-XYZ)

searchts (Python, MIT, on PyPI) - The missing layer between AI and the web: a keyless open-source unlocker that gets agents past bot-walls (Cloudflare, PerimeterX, DataDome) via an escalating fetch ladder (browser-fingerprinted TLS, JS-render relay, stealth browser, human-in-the-loop CAPTCHA). Decodes ChatGPT, Claude, Gemini, Grok, and Poe share URLs into complete role-labeled conversations, which no generic reader can. Plus keyless multi-provider search with rank fusion, video transcription with Whisper fallback, and prompt-injection scrubbing. CLI + MCP server + Claude Code skill.

burncard (TypeScript, npx burncard) - Accurate local AI usage telemetry for Claude Code and Codex, computed from your own logs on your own machine.

Grove (Rust/Tauri/Svelte, GPL-3.0) - Git review companion for AI coding editors: custom SVG commit graph, real merge-commit diffs, blame, spotlight search, worktree dashboard for multi-agent workflows.

GlyphMaps (Kotlin, AGPL-3.0, shipped v1.0.0) - Google Maps turn-by-turn navigation on the Nothing Phone's rear LED matrix, built on a reverse-engineered notification pipeline and an unthrottled matrix path the official API does not expose.

beep-beep-oss (Rust/Tauri/Matrix, AGPL-3.0) - Self-hostable universal chat client; working two-way WhatsApp messaging via maatrix bridges and matrix-rust-sdk.

wmux (TypeScript, external contributor) - Diagnosed and fixed a main-process freeze. CPU profile put 92% of self-time in synchronous fs calls under a 2s poll; established that a stalled event loop and a broken pipe are indistinguishable from the CLI. Took `system.identify` from timeout to 0.7ms. Merged, shipped in v0.40.0; maintainer called it "*one of the best bug reports this project has had*".

SKILLS

AI engineering	Agentic assistants with safety-gated actions (propose-then-confirm, server-side revalidation, idempotency keys, tamper-resistant audit chains), multi-provider LLM APIs (OpenAI / Gemini / Claude), MCP servers, usage and cost telemetry, prompt-injection defense
Daily driver	React, Next.js, TypeScript, Tailwind, Node, Express, MongoDB
AI-assisted delivery	Claude Code (power user), custom agent harnesses; used to ship production desktop and mobile apps outside my primary stack, including Rust/Tauri and Kotlin/Android
Working knowledge	Python, Rust, Tauri, Kotlin/Android, React Native (Expo)
Infra	AWS (S3), Cloudflare, GitHub Actions, Docker, PyPI/npm release automation

EDUCATION

BCA (Hons.), The Maharaja Sayajirao University of Baroda 2024 - 2028 (expected)
